WAVE SPEED

DETERMINING WAVE SPEED

- Universal Wave Equation
- valid for all waves and wave types
- frequency (cycles / time) x wavelength (dist./cycles)

$$v = f \lambda$$

USING THE UNIVERSAL WAVE EQUATION (PG. 389)

1. If a wave has a frequency of 230 Hz and a wavelength of 2.3 m, what is its speed? T/1

[ans: 530 m/s]

Given:

$$f = 230 \text{ Hz}$$
$$= 230 \frac{1}{\text{s}}$$

$$\lambda = 2.3 \text{ m}$$

Required:

$$v = \text{speed}$$

Analysis:

$$v = f\lambda$$

Steps:

$$v = \left(230 \frac{1}{\text{s}}\right) (2.3 \text{ m})$$

$$v = 530 \text{ m/s}$$

USING THE UNIVERSAL WAVE EQUATION (PG. 389)

2. If a wave has a speed of 1500 m/s and a frequency of 11 Hz, what is its wavelength?

[ans: 140 m]

Given: $v = 1500 \frac{\text{m}}{\text{s}}$

$$f = 11 \text{ Hz}$$
$$= 11 \frac{1}{\text{s}}$$

Required: $\lambda = \text{wavelength}$

Analysis: $v = f\lambda$

Steps: $\lambda = \frac{v}{f}$

$$\lambda = \frac{1500 \frac{\text{m}}{\cancel{\text{s}}}}{11 \frac{1}{\cancel{\text{s}}}}$$

$$\lambda = 140 \text{ m}$$

USING THE UNIVERSAL WAVE EQUATION (PG. 389)

3. If a wave has a speed of 405 m/s and a wavelength of 2.0 m, what is its frequency? T/I

[ans: 2.0×10^2 Hz]

Given: $v = 405 \text{ m/s}$
 $\lambda = 2.0 \text{ m}$

Required: $f = \text{frequency}$

Analysis: $v = f\lambda$

Steps: $f = \frac{v}{\lambda}$

$$f = \frac{405 \cancel{\text{m/s}}}{2.0 \cancel{\text{m}}}$$

$$f = 202 \left(\frac{1}{\text{s}} \right)$$

$$f = 2.0 \times 10^2 \text{ Hz}$$

FACTORS THAT AFFECT WAVE SPEED

- More rigid intermolecular forces allow for a faster transfer of energy, and therefore a higher wave speed in a medium
- Waves travel faster in hotter gases than in cooler gases because of the increased molecular motion caused by the higher temperature in a hotter gas

LINEAR DENSITY AND TENSION (STRINGS)

- A string's linear density, (mass per unit distance) determines how much force it will take to make the string vibrate

$$\mu = \frac{m}{L}$$

- m is the mass of the string in kilograms
- L is the length of the string in metres

LINEAR DENSITY AND TENSION

- Another variable affecting wave speed is tension. A loose string will absorb energy, a taut (tight) string will transmit energy very effectively

$$v = \sqrt{\frac{F_T}{\mu}}$$

- F_T is the tension in the string (N)
- μ is the linear density (kg / m)

DETERMINING STRING PROPERTIES (PG. 391)

1. If a 2.5 m long string on the same wave machine has a tension of 240 N, and the wave speed is 300 m/s, what is the mass of the string? μ [ans: 6.7×10^{-3} kg]

Given: $L = 2.5\text{m}$
 $F_T = 240\text{N}$
 $v = 300\text{m/s}$

① determine μ
② determine m

Required: $m = \text{mass}$

Analysis: $\mu = \frac{m}{L}$

$$v = \sqrt{\frac{F_T}{\mu}}$$

Steps: $v = \sqrt{\frac{F_T}{\mu}}$

$$v^2 = \frac{F_T}{\mu}$$

$$\mu = \frac{F_T}{v^2}$$

$$\mu = \frac{240 \text{ N}}{\left(300 \frac{\text{m}}{\text{s}}\right)^2}$$

$$= \frac{240 \text{ kg} \frac{\cancel{\text{m}}}{\cancel{\text{s}^2}}}{90\,000 \frac{\cancel{\text{m}^2}}{\cancel{\text{s}^2}}}$$

$$\mu = 2.667 \times 10^{-3} \text{ kg/m}$$

$$\mu = \frac{m}{L}$$

$$m = \mu L$$

$$= 2.667 \times 10^{-3} \text{ kg/m} \times 2.5 \text{ m}$$

$$m = 6.7 \times 10^{-3} \text{ kg}$$

DETERMINING STRING PROPERTIES (PG. 391)

2. If a wave machine string has a linear density of 0.2 kg/m and a wave speed of 200 m/s, what tension is required? **T/I** [ans: 8×10^3 N]

Given: $\mu = 0.2 \text{ kg/m}$
 $v = 200 \text{ m/s}$

Required: $F_T = \text{tension}$

Analysis: $v = \sqrt{F_T/\mu}$

Steps $v = \sqrt{F_T/\mu}$

$$v^2 = \frac{F_T}{\mu}$$

$$F_T = v^2 \mu$$

$$F_T = \left(200 \frac{\text{m}}{\text{s}}\right)^2 0.2 \frac{\text{kg}}{\text{m}}$$

$$F_T = \left(40000 \frac{\text{m}^2}{\text{s}^2}\right) \left(0.2 \frac{\text{kg}}{\text{m}}\right)$$

$$F_T = 8000 \frac{\text{m kg}}{\text{s}^2}$$

$$F_T = 8 \times 10^3 \text{ N}$$

DETERMINING STRING PROPERTIES (PG. 391)

3. If a string on a wave machine has a linear density of 0.011 kg/m and a tension of 250 N, what is the wave speed? T/I [ans: 1.5×10^2 m/s]

Given: $\mu = 0.011 \frac{\text{kg}}{\text{m}}$
 $F_T = 250 \text{ N}$
 $= 250 \frac{\text{kg} \cdot \text{m}}{\text{s}^2}$

Required: $v = \text{speed}$

Analysis: $v = \sqrt{\frac{F_T}{\mu}}$

Steps:

$$v = \sqrt{\frac{250 \frac{\text{kg} \cdot \text{m}}{\text{s}^2}}{0.011 \frac{\text{kg}}{\text{m}}}}$$

$$v = \sqrt{22727 \frac{\text{m}^2}{\text{s}^2}}$$

$$v = 150 \text{ m/s}$$

$$\begin{aligned} & \frac{\text{m/s}^2}{\frac{1}{\text{m}}} \\ &= \frac{\text{m}}{\text{s}^2} \times \frac{\text{m}}{1} \\ &= \frac{\text{m}^2}{\text{s}^2} \end{aligned}$$
